1 Drafting

Right now i have start the bone structure of this project (only files position) i need to farther research about what lexical features i shuold extract for each of the link.

1.1 Concerns

there's some issue is that i don't think it is possible to extract OSINT info for the whole dataset because the data is 600k rows and it's not possible. Therefore, the plan right now is to make 2 modles and train on different datasets.

For the types there's more than 1 i don't know if we should identify by each one or just combine them as phising.

1.2 Plan

I think i will complete the lexcial only feature first. train the modle on that and then later on perform the passive OSINT and then combine the 2 modles together to evaluate the URL
